Sizing and Selection

Measure the length, width and height (in feet) of the sauna. Multiply the three measurements together to get the basic room volume in cubic feet.

L x W x H = CUBIC FEET

Divide the CUBIC FOOTAGE BY 50 = Kilowatts Required

(Select the next size of Saunacore model stove which exceeds the calculated room cubic feet.)

Example:

7ft length, 5ft wide, 7ft high ($7 \times 5 \times 7 = 245$)

245 divided by 50 = 4.9 KW

a 5 KW (5000 WATT) is required.

If there is any doubt in size, always recommend the next larger size.

(This is general guideline.)

* Saunacore reserves the right to change, alter and discontinue models and pricing at any time.
