Sizing and Selection

Measure the length, width and height (in feet) of the steam shower. Multiply the three measurements together to get the basic volume in cubic feet.

$$L \times W \times H = \text{CUBIC FEET} \times \text{multiplier}$$

Wall Finish of Shower	(is multiplied by)
Acrylic, cultured marble	
Ceramic Tile on Cement Board	1.25
Ceramic Tile on Motar Bed	1.30
Glass or Glass Block	1.20
Porcelain tile on Cement Board	1.60
NATURAL STONE TILE (granite, marble, slate)	
On Motar Board	2.00
Natural Stone Slabs over 1/2" thick	2.25
Each Exterior Wall(s) insulated	1.10

Example:

A ceramic steam shower with the dimensions 7ft length by 5ft wide and 7ft high (7ft x 5ft x 7ft = 245), is 245 Cubic feet.

Since the steam shower has ceramic wall finishes, it then requires a 25% cubic footage increase.

$$(\text{Ceramic tile}) 25\% \times (\text{steam shower}) 245 = 61.25 \text{ ft}$$

The wall finish cubic feet is then added to the original dimensions to calculate the total cubic footage, which in this case is 306.25ft.

$$(\text{ceramic tile}) 61.25 + (\text{steam shower}) 245 = 306.25 \text{ ft}$$

Now select the next size of Steamcore model generator which exceeds the calculated room cubic feet. This case the KWS (9000 watts) generator is required. If there is doubt in size, it is recommended to choose the next larger size.
